Online Supplemental Material

Supplemental Figure 1. Cognitive restraint (CR, panel A), disinhibition (DI, panel B) and hunger (HU, panel C) mean scores and 95% CIs during the 10-year study period in banding, vertical banded gastroplasty (VBG) and gastric bypass (GBP) groups. ANOVA/ANCOVA models were used to assess differences between the three surgical procedures. Baseline level was adjusted in the analysis of longitudinal treatment effects. For a null hypothesis that $\mu_1 = \mu_2 = \mu_3$: $^1p < 0.001$, $^2p < 0.01$, $^3p < 0.05$.
