Supplemental Figure S3: Graphical presentation of the relationship between relative leukocyte telomere length (rLTL) and parameters of muscle mass in BASE-II participants aged ≥60 years; A) appendicular lean mass (kg) vs. rLTL, B) appendicular lean mass/BMI vs. rLTL and C) leg lean mass (kg) vs. rLTL separately for men (blue dots) and women (black dots). Each graph displays regression lines, regression equation and R squared separately for men (blue) and women (black).
