Figure S2
Bland and Altman plots of the difference between CP-specific equations of body composition and energy expenditure compared with the reference method.

Bland and Altman plots of the differences of percentage body fat from (a) two skinfolds, calculated by the Slaughter equation after applying Gurka’s corrections (%BF-GURKA) (n=54), (b) bio-impedance, calculated by the Pencharz equation (TBW-PENCHARZ) (n=61) and (c) total energy expenditure from the equation by Krick et al. (KRICK) (n=54) compared with their corresponding outcome of the reference method.
