Supplemental Figure 1. Soy intake and the risk of lung cancer by gender (male vs. female). Squares represent study-specific estimates (size of the square reflects the study-specific statistical weight, i.e. inverse of the variance); horizontal lines represent 95% CIs; diamonds represent summary estimates with corresponding 95% CIs.
**Supplemental Figure 2.** Soy intake and the risk of lung cancer by study populations (Asians vs. Non-Asians). Squares represent study-specific estimates (size of the square reflects the study-specific statistical weight, i.e. inverse of the variance); horizontal lines represent 95% CIs; diamonds represent summary estimates with 95% CIs. M: men, W: women, RR: relative risk; CI: confidence corresponding interval.
Supplemental Figure 3. Soy intake and the risk of lung cancer by smoking status (i.e., current, ever, and never smokers). Squares represent study-specific estimates (size of the square reflects the study-specific statistical weight, i.e., inverse of the variance); horizontal lines represent 95% CIs; diamonds represent summary estimates with corresponding 95% CIs. M: men, W: women, RR: relative risk; CI: confidence interval.
