Web Figure 1. Additional Averted Cases across Ages, by Vaccine Choice Strategy and Influenza Infectivity for an Influenza Vaccine Coverage Increase of 6.5%

The number of additional cases averted (relative to the No Choice condition) against age in years at the three levels of coverage increase due to choice is shown for Mild Infectivity (left panel), Moderate Infectivity (center panel), and High Infectivity (right panel). In each of the three plots, the values for Choice in Both Age Groups (blue squares), Pediatric Choice (red circles), and Adult Choice (green triangles) are shown. The dashed gray vertical line intercepts the x-axis at a value of 18 years.
