Supplementary Figure 1

Plots of linear regression models fitted with log of MMA (μmol/L) as the dependent variable and each of the variables: log serum B12 (pmol/L), holoTC (pmol/L), tHcy (μmol/L), log RBC folate (nmol/g hemoglobin) and log total B12 intake (μg/day) as predictor. Plots were adjusted for age (continuous), sex, race (white/black) smoking (never/ever), alcohol (never/ever), medication use (yes/no) and blood creatinine (continuous). Plots below show estimated log MMA (and pointwise 95% CI) after adjustment.
