Supplementary figures

Suppl. Fig. 1: Medicine pacifier modified for saliva collection in children <1 year of age: a: perforations of the teat, b: strips of filter paper.

Suppl. Fig. 2: Non-linear regression analysis of salivary 17OHP levels vs. age. Significant correlations (p<0.001) were found for all three collection times (morning: $r^2 = 0.63$; noon: $r^2 = 0.79$; evening: $r^2 = 0.79$).

Suppl. Fig. 3: Non-linear regression analysis of salivary P levels vs. age. Significant correlations (p<0.001) were found for all three different collection times (morning: $r^2 = 0.42$; noon: $r^2 = 0.60$; evening: $r^2 = 0.66$).
