Keywords: Prosthetic heart valves; Pannus formation; Multidetector computerised tomography; Trans-oesophageal echocardiography

A 56-year-old woman with a history of mechanical mitral valve replacement 9 years earlier, presented with signs of severe valve obstruction assessed by echocardiography (Fig. 1(A) and (B), video 1). Multidetector computerised tomography clearly depicted pannus overgrowth as the cause of obstruction (Figs. 1(C), (D) and 2(A), (B)). She underwent re-replacement and the pannus was confirmed surgically (Fig. 2(C) and (D)).
