

Figure S8 Convergent evolution of freshwater gill raker length reduction

Gill raker lengths were measured in three domains: lateral (A), middle (B), and medial (C) in marine (LITC) and freshwater (FTC and BEPA) lab-reared fish. See Figure 5A for a diagram of gill raker length measurements. Gill raker lengths were back transformed to values expected for a 50 mm standard length fish. *** indicates $p < 0.001$, n.s. = not significant by Tukey's HSD test. $n=10$ per population.
