

FIGURE S1.—An FSC loss event in which the youngest labeled follicle cells were posterior-biased. Panel A shows the merged image and panel B shows the clonal marker (β -galactosidase) only. Curved white line indicates the approximate position and shape of the posterior-biased clone. Ommatidia were stained with anti-FasIII (red), anti- β -galactosidase (green) and DAPI (blue). Scale bar is 10 μ m.
