FIGURE S2.—This figure gives a tableau of x-y plots as in Figure 1, for the Chimpanzee data of BECQUET et al. (PLoS Genetics, 2007). The details are the same as for Figure 1. In comparison with the simulated data it can be seen that the Chimpanzee data often appears in the outer regions of the prior-predictive distribution, but is never a clear outlier. In addition the data may, in some projections, appear outside the distribution of blue points. Note, however, that the use of Euclidean distance does not imply that the ‘closest’ points will appear close in all projections.
