Figure S2  \textit{bdf1Δ} is synthetically lethal with \textit{bdf2Δ}. None of the viable spores from a \texttt{bdf1::kanMX6 \times bdf2::hphMX6} cross were able to grow on YES medium, indicating that \textit{bdf1Δ bdf2Δ} cells are inviable. Genotypes of viable spores are shown. Representative images of >40 tetrad dissections from the \texttt{bdf1 \times bdf2} cross are shown.
