

Figure S4 Founder haplotype means and 1-SDs at the pB-specific peak at position 7,500,000-8,440,000 on chromosome 2R. This interval harbors P450 gene *Cyp6g1*. The number of RILs for which we confidently assign a founder genotype (probability > 0.95) is listed at the bottom of each bar, and only founder means associated with at least 5 observations are presented.
