

**Supplementary Table 1 :****Comparison of genes commonly de-regulated at symptomatic ages (90 and 120 day old) in SOD1<sup>G93A</sup> motoneurons using microarrays**

List of the principal genes whose transcripts were regulated by 1.5- fold or more ( $p<0.05$ ) in mutant mice at two symptomatic ages. RNA was extracted from 2000 - 2400 microdissected motoneurons issued from one animal. Three chips were analyzed for each condition (control and mutant). Gene expression levels were compared in disease versus control animals. Fold change was calculated as the ratio between the average values of expression in mutant animals relative to the average values of controls; in all comparisons, a positive value indicates a higher level of expression in mutant animals versus negative numbers that show a higher level in controls.
