Supplementary Figure S3 Impact of extended (46 h) PMC on maturation, fertilization and blastocyst production. Bar graph displays the main outcomes of the PMC + IVM culture of Group II oocytes after 24 h PMC (patients \( n = 5 \), oocytes \( n = 43 \)) and 46 h PMC (patients \( n = 7 \), oocytes \( n = 55 \)) followed by 30 h IVM. Maturation potential (metaphase II, MII), fertilization rate (2 pronuclei, 2PN), yield of good-quality embryos on Day 3 (GQED3) and blastocyst production did not differ between the two PMC time points. Statistics by chi square test (ns).
