Supplementary Figure S7. Distribution of slopes of linear regressions (LMs) of total motile sperm count (TMSC) on year for each accepted donor during the period 2019–2022. We included only accepted donors who donated samples in at least two of those years for a total of at least 8 ejaculates. This histogram summarizes those slopes in bins of 0.01 from linear models with year, accepted donor age, and monthly mean temperature as fixed effects.
