Eight genes previously implicated in IHH were sequenced in all IHH men using PCR primers and amplification conditions that have been previously described: KAL1 (1), GNRHR (2), GPR54 (3), NELF (4), FGF8 (5), FGFR1 (6), PROK2 (7), and PROKR2 (7). DAX1 (NROB1) was also screened in a subset of IHH men (8 of 10 patients in group 1 of atypical responders) as previously described (8).
