19. List of Figures

Figure 4-1. Linear (g/d) and exponential rates [g/(kg·d)] of fetal growth calculated from the data (50th percentile) of Alexander et al. (1996) and Lubchenco et al. (1963), showing a wide discrepancy between data from the two studies. 1406S

Figure 7-1. Transsulfuration pathway 1427S

Figure 9-1. Metabolic pathways for polyunsaturated fatty acids 1450S

20. List of Tables

Table 3-1. Composition of selected preterm infant formula per 100 kcal 1402S

Table 3-2. Selected compositional characteristics of preterm infant formulas 1402S

Table 4-1. Variations in body composition as a percentage of weight gained during different postconceptional time periods 1403S

Table 4-2. Characteristics of selected studies used to estimate intrauterine fetal growth rate 1405S

Table 5-1. Estimation of maximum potential renal solute load based on available water for an 81 kcal/100 mL formula 1410S

Table 5-2. Calculation of potential renal solute load resulting from the maximum and minimum nutrient contents recommended by the Expert Panel for preterm infant formula of 81 kcal/100 mL 1411S

Table 5-3. Relationship of energy density of formula, water available for urine formation, and upper limit of potential renal solute load for formula, assuming no growth of preterm infant 1411S

Table 6-1. Existing recommendations for energy intake by preterm infants and provision of energy in preterm formulas 1412S

Table 7-1. Previous recommendations for protein in preterm formula 1416S

Table 7-2. Estimates of protein requirements and advisable intakes using the factorial method 1417S

Table 7-3. The essential amino acid content of preterm infant formula recommended by the Expert Panel 1431S

Table 8-1. Rates of endogenous glucose production and oxidation in newborn infants and children 1441S

Table 10-1. Trials of calcium supplementation successful in increasing bone mineralization in premature infants above that obtained with mother's milk 1465S

Table 12-1. Calculated dietary zinc requirements 1480S

Table 14-1. The minimum and maximum values for thiamin, niacin, vitamin B₁₂, pantothenic acid, and biotin in preterm infant formula recommended by the Expert Panel 1523S

Table A-1. Developmental milestones in renal physiology 1561S

Table B-1. A comparison of recommendations for the composition of infant formulas, including the Expert Panels' recommendations for the composition of preterm infant formulas 1572S
