Supplemental figure 4: Comparison of estimated habitual folate intake distributions (µg/d) for males 19-50 y (A), females 19-50 y (B), boys 9-13 y (C), and girls 9-13 y (D) from AGE MODE and the ISU method by Nusser et al. (6). For the AGE MODE results the mean intake of individuals from 19 to 50 years is shown, whereas for children intake distributions for all ages within the specific age range are shown.
