Supplementary Fig. 2: Effect of different flavonoids on 3T3-L1 preadipocyte differentiation
3T3-L1 cells were exposed to induction media and exposed to genistein (Gen), formononetin (For), biochanin A (Bio). After 8 d of exposure to isoflavones, differentiated cells were stained with Oil-Red O. Photomicrographs at 400X magnification. * Cells were treated with Biochanin A at a dose of 5 µmol/L.
