Supplemental Figure 2: Flavonols does not affect ERK phosphorylation induced by HGF in DAOY. DAOY were serum-starved for 16 h and then treated for 2 h with the vehicle, quercitrin, quercetin, myricetin, kaempferol or EGCG at the indicated concentrations. Cells were then stimulated with recombinant HGF (50 g/L) for 3 min. Cells were lysed and equal amounts of protein (10 µg) were analysed by SDS-polyacrylamide gel electrophoresis followed by electrotransfer onto PVDF membranes. Immunoblot detection was performed with polyclonal antibodies directed against the phosphorylated form of ERK. Total ERK found in cell lysates were detected as control and GAPDH was used as an internal standard.
