Supplemental Fig. 2. Cytokine expression in CT of chickens fed either FOS, MOS, ZnB or control diet. IL-6, IFNγ and IL-10 mRNA levels in CT were measured using qRT-PCR. GAPDH was used as a housekeeping gene to standardize results. Mean cytokine expression for each group is shown after deducting the Ct for GAPDH. Data represents mean ΔCt ± SEM values for each treatment group (n=6). No significant difference was observed between the groups for any of the cytokines.
