Supplemental Figure 2. Trial Profile. Randomization was done at the level of school prior to assessment of child eligibility. All children in each school received the intervention allocated to that school regardless of if they participated in the anthropometric, biochemical and parasitological assessments. This figure shows the flow of only those children who were included in the anthropometric, biochemical and parasitological assessments.

1One child was excluded (did not meet inclusion criteria for the study (n=1).
2Twenty-nine children were lost to follow-up since baseline [changed school (n=22); travelled out of village (n=7)].
3Fifteen children were lost to follow-up since baseline [changed school (n=6); travelled out of village (n=7); sick (n=1); parents refused blood draw (n=1)].
