Supplemental Figure 1:
Linear regression between the change in transsulfuration rate (TS) and carboxyl-labeled methionine flux (Q_c) after vitamin B-6 restriction and the plasma glycine concentration at normal vitamin B-6 status in 9 healthy men and women.

TS: $\rho = -0.88$, $P < 0.0001$

Q_c: $\rho = -0.88$, $P < 0.0001$
