Supplemental Figure 2. IL-1β (A) and IL-6 mRNA (B) expression in colonic mucosa of ZA and MZD rats with and without 2% DSS treatment. Relative expression levels were determined by RT-qPCR and calculated after normalization against GAPDH using a standard curve. Values are expressed as means ± SEM (n = 5–6). Data were analyzed with a two-way ANOVA. NS, no significant difference (P ≥ 0.05).
