SUPPLEMENTAL FIGURE 1 Correlation between fractional iron absorption from infant formula (standard formula, α-LAC, and α-LAC/RGMP) and serum ferritin concentration (presented on logarithmic scale) in 6-mo-old infants (n = 31).

iron absorption\(_{\%}\) = -3.37 × ln(serum ferritin\(_{\mu g/L}\)) + 21.75

\(r = -0.49\)

\(P = 0.005\)
