Supplemental Figure 3. Lymphatic absorption rate of ARs and plasma AR concentrations in a pig given a single dose of AR (1300 µmol.) Lymph was collected continuously in hourly intervals during 8 h following dose administration and again for 30 min at 16 h after dose, while blood was collected for 24 h after administration. Values are mean of analytical replicates (n=2-6; except plasma concentration at 3h where only one measurement was available) and error bars represent SEM.
