Supplemental Figure 3. Comparison of within person reproducibility in terms of ICCs with correlations given as Spearman coefficients ($\rho$) for biomarkers in plasma samples collected 1 – 2 years apart from postmenopausal women in the NHS. ICC, intraclass correlation coefficient, was calculated using natural log-transformed analyte values. Data are taken from Table 1. Non-standard abbreviations: DMG, dimethylglycine; ADMA, asymmetric dimethylarginine; SDMA, symmetric dimethylarginine. N=40.
