Supplemental Figure 1. The percentage of daily protein intakes from animal foods, plant foods, and breastmilk for children aged 6-35 mo from six low-income countries.

Intakes are expressed as the percentage of protein intakes from animal-source foods, plant-based foods, and breastmilk (if applicable) of children by age and breastfeeding status (for cohorts with quantified breastmilk intakes). Values were obtained by dividing the sum of the protein intakes from each source for all person-days by the sum of the total protein intakes for all person-days within each cohort.
