

Supplemental Figure – English et al.

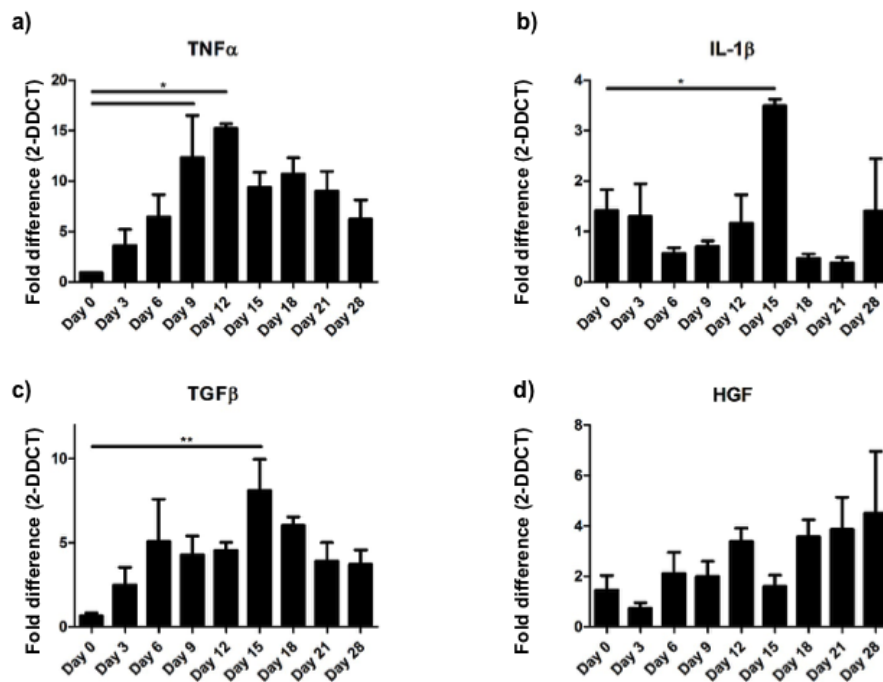

Figure S1. mRNA expression analysis of inflammatory and fibrotic genes; Bleomycin time course.

C57BL/6 mice were treated with bleomycin by IN administration. Four mice were sacrificed every 3 days for 28 days and the lungs were processed for RNA isolation. Following cDNA synthesis, real time PCR was run for a) TNF- α b) IL-1 β c) TGF β and d) HGF. The results were graphed and analysed for statistical difference (*, $p < 0.05$; **, $p < 0.01$).
